Article writing with LLMs

RULLMR Session 06 | Preparation for Thursday 12 November 2026

Choose a short passage from a **paper or thesis you are writing**, or something you still need to write. Use an LLM to help you write or improve it, then revise the result yourself. Treat it as text you might actually publish under your own name. **Would you put your name to the result?**

Allow about **1 hour**. A finished section or perfect result is not required; your decisions and experience are what we will discuss.

What to do

1. **Choose your text and goal.** One or a few paragraphs from an Introduction, Methods, Results or Discussion is enough. Decide what you want to improve, such as structure, clarity, concision or tone. If you are starting from scratch, write your own outline and gather the checked sources or results the text needs.
2. **Write down what you want to say.** Before asking AI, note your main message and the facts and qualifications that must stay intact. Think about your intended reader and the style you want.
3. **Write or revise with AI.** Give the model your material and a clear task. Try follow-up instructions if the result does not say exactly what you mean or sound like you. Keep the first AI version and the prompts you used.
4. **Check and edit it yourself.** Compare the result with your original text or outline. Check claims, numbers and references against your sources. Look for changes in meaning, omitted qualifications and invented information. Decide which suggestions to accept, reject or rewrite, and save the version you would actually use.

Bring your text and experience

Bring your **laptop**, your original passage or outline, the first AI version and your own final revision. Mark a few changes that show what you accepted, rejected or rewrote. Keep a brief log of the model and version, prompts, material supplied and your checks.

Be ready to explain **one useful improvement and one change you had to correct or reject**. What did AI help with? What still needed your own judgement? When would the text be good enough to publish, and how would you describe AI's contribution to your co-authors?

Optional practice

You are provided with an HTML template (`results.html`) and a CSV dataset (`demo-patients.csv`).

Use Copilot to write code that automatically updates the results in the HTML file based on the CSV data.

Then, ask Copilot to apply different inclusion or exclusion criteria and update the results accordingly, without manually editing the HTML.

Open the updated HTML file in your browser and check whether the results are correct.

Choose material you may use

Use a tool permitted for your chosen material. Do not upload confidential manuscripts, co-author text or unpublished results to an unapproved service. If you cannot use your own text safely, use a public or fictional passage.
