Guide for Readers – Generative AI in Brief

Principle: room to use it where possible, safeguards where necessary

LUMC is positive toward the use of generative AI. Generative AI may in principle be used as a supporting tool. No prior approval is required as long as its use complies with this policy and existing LUMC frameworks.

What do I need to know?

1. Generative AI may be used as a supportive tool

Existing rules regarding privacy, information security, confidentiality, copyright, and professional conduct remain in force. AI does not create any new authority to use or share information.

2. LUMC Copilot may be used for all LUMC data categories

This includes confidential information, personal data, and patient data. You must be authorized to process the information, and the use must comply with applicable LUMC policies.

3. Other generative AI services may also be used

Only use information that can responsibly be shared with the external service. Personal data, patient data, and confidential LUMC information may only be processed in an AI service that has been approved by LUMC.

4. You remain responsible for the outcome

Verify AI-generated output to the degree appropriate for the purpose and potential consequences. The greater the possible impact of an error, the more verification is required.

5. Use no more data than necessary

Even when using an approved AI service, the principle of data minimization applies. Use only the information reasonably required. This also applies to LUMC Copilot.

What is outside the scope of this policy?

This policy concerns generative AI used as a supporting tool. The following are outside its scope:

- Autonomous or agentic AI that independently performs actions or accesses systems.
- AI used for diagnosis, triage, treatment, medical decision-making, or generating new patient-specific medical conclusions, predictions, or recommendations.
- Developing, training, validating, or researching AI systems, and AI used as part of scientific research or for analysis of research data.
- AI used for testing, examinations, and other educational activities governed by specific educational regulations.

Separate frameworks apply or will be established for these applications.

Being outside the scope of this policy does not mean such use is prohibited.

Do you want to know more? See Appendix A – Practical Guide for the Use of Generative AI for examples and consult in case of doubt existing LUMC AI expertise teams and information channels.

1 Introduction

LUMC is in principle positive about the use of generative AI. As a university medical center, research, learning, innovation, and pushing boundaries are part of its identity. Curiosity about new technologies and exploring how they can improve work align naturally with this mission.

Generative AI offers new opportunities to:

- Make knowledge more accessible
- Structure information
- Develop ideas
- Perform work more intelligently and efficiently

LUMC aims to provide employees and students with room to explore and benefit from these opportunities. Failing to use new technologies, or using them insufficiently, can also create risks. It may reduce innovation capacity, quality, scientific standing, societal impact, and attractiveness as an academic institution.

The use of generative AI as a tool is generally permitted. Restrictions will only be imposed when there is a concrete reason, such as privacy, confidentiality, information security, intellectual property, or legal requirements.

In principle, the same standards for information protection apply to generative AI as to other digital tools and cloud services. However, generative AI may involve additional risks due to:

- The way entered information is processed and used
- Limited predictability and explainability of generated output
- The manner in which providers handle data

Where such risks exist, appropriate safeguards are implemented.

Our principle: room to use it where possible, safeguards where necessary

2 Purpose and scope

This policy describes the conditions under which employees, students, and third parties performing work on behalf of the LUMC may use generative AI as a supporting tool. Under generative AI, this policy means digital applications that enable a user, by means of an instruction or prompt, to generate new content, such as text, images, audio, video, or computer code. Generative AI may, for example, be used for brainstorming and developing ideas, writing and rewriting texts, summarizing, translating, organizing and structuring information, creating presentations and other content, supporting programming, and carrying out other administrative or substantive activities.

This policy concerns the use of generative AI as a tool. It is not a general AI policy for all applications of artificial intelligence within the LUMC.

2.1 Outside the scope

The following applications fall outside the scope of this policy:

- AI systems that independently perform actions, control processes, or access other systems, including autonomous or agentic AI systems;
- AI that is applied for diagnostics, triage, treatment, medical decision-making, or for generating new patient-specific medical conclusions, assessments, predictions, or recommendations;
- The development, training, validation, or study of AI systems, and the use of AI as part of scientific research or for the processing or analysis of research data.

For these applications, separate policy frameworks and procedures apply or will be established.

The fact that an application falls outside the scope of this policy does not mean that it is prohibited within the LUMC. Questions regarding such applications may be submitted to Topdesk and the AI Team (ai@lumc.nl).

The use of generative AI as a supporting tool in scientific research does fall within the scope of this policy, for example for formulating, rewriting, translating, or structuring texts, exploring ideas, or carrying out other supporting activities. This applies as long as the AI itself is not a research object or part of the research methodology and is not used for the processing or analysis of research data.

For healthcare professionals, generative AI may, within this policy, be used for administrative and textual support, but not as part of medical treatment or decision-making.

3 Principles

3.1 Use is permitted in principle

In principle, no prior approval is required for the use of generative AI as a supporting tool. By doing so, the LUMC does not adopt the principle of "prohibited unless permitted," but rather of responsible use within clear boundaries.

3.2 Existing rules remain applicable

The use of generative AI does not change existing responsibilities and obligations. Rules concerning, among other things, privacy, information security, confidentiality, copyright, intellectual property, and professional conduct remain applicable.

Generative AI does not in itself create any new authority to use or share information.

Anyone who would not be permitted to access certain information without generative AI, or who would not be permitted to share that information with a particular party, is also not permitted to do so through the use of generative AI.

3.3 Not the technology, but the risk is decisive

A restriction is not imposed solely because AI is being used. The purpose of the use, the nature of the information, the selected AI service, and the possible consequences determine which safeguards are necessary.

This also means that information that is considered internal within the LUMC is not automatically unsuitable for use in an external generative AI service.

The determining factor is whether the information can be shared and processed responsibly with the relevant service.

3.4 The user remains responsible

Generative AI supports the user but does not take over the user's professional duties and responsibilities. The user remains responsible for the manner in which generative AI is used and for the ultimate use of the generated output.

3.5 Verification is proportionate

Not every AI-generated output requires the same degree of verification. A proposed meeting agenda or an alternative wording requires a different level of verification than information that is used in a management advisory document or another context in which errors can have significant consequences.

The degree of verification must therefore be appropriate to the purpose of the use and the potential consequences of an incorrect outcome.

4 LUMC-evaluated generative AI services

The LUMC may assess generative AI services and declare them suitable for processing certain types of information. In doing so, consideration is given, among other things, to privacy, information security, contractual arrangements, storage and processing of data, and the manner in which the provider handles submitted information and generated output.

The assessment is carried out by the functions within the LUMC that are responsible and possess the relevant expertise, and is explicitly documented. Where applicable, the regular LUMC processes for, among other things, privacy, information security, supplier assessment, and contracting are followed. An assessment that has previously been conducted is reviewed again when relevant changes in the AI service, the processing of data, the intended use, the contractual arrangements, or applicable laws and regulations give cause to do so. The further methodology, responsibilities, and criteria for assessment and reassessment are laid down in the applicable LUMC assessment framework or review procedure.

For each assessed AI service, it is determined which categories of data may be processed within it. Declaring an AI service suitable for certain data categories does not automatically mean that every application of that service is suitable for every work process. When the nature, scale, or possible consequences of a specific application give reason to do so, an additional assessment or validation of that application may be necessary. When an AI service has been found suitable by the LUMC for the relevant data category, the user does not need to independently reassess the privacy and information security suitability of that AI service. The normal rules regarding access to and use of that information naturally remain applicable.

4.1 Microsoft 365 Copilot

Microsoft 365 Copilot has been made available by the LUMC as the standard environment for generative AI and may be used within the LUMC environment configured for that purpose for all data categories used within

the LUMC, including internal and confidential information, personal data, and patient data.

This does not mean that Copilot may be used without restriction for every purpose. The user must be authorized to process the relevant information, and the intended use must fall within the scope of this policy and other applicable LUMC frameworks.

For example, the fact that patient data may be processed in the LUMC Copilot environment does not mean that generative AI may therefore be used without limitation for diagnostics, treatment advice, or medical decision-making. Such applications fall outside the scope of this policy.

The LUMC may in the future also declare other generative AI services suitable for certain or all data categories. For that reason, an up-to-date overview is maintained separately from this policy.

5 Use of other generative AI services

Employees are not required to make use exclusively of generative AI services provided by the LUMC. The LUMC recognizes that other generative AI services may offer different capabilities, may function better for certain activities, or may provide new possibilities that are not yet available within the standard environment. The LUMC therefore does not wish to unnecessarily restrict the responsible use and exploration of such services.

For generative AI services that have not been approved by the LUMC for the relevant data category, the principle is that only information may be processed that is public or can be shared outside the LUMC without objection.

In addition to public information, this includes non-public information for which external disclosure would not reasonably result in any relevant risk to the LUMC or to the persons concerned, and to which no legal, contractual, or other restrictions apply. The classification 'internal' therefore does not in itself constitute an obstacle to the use of an external generative AI service.

Personal data, patient data, confidential or highly confidential LUMC information, and other information that cannot be shared outside the LUMC without objection, may be processed only in a generative AI service that has been approved by the LUMC for the relevant data category.

A practical rule of thumb is that information that may not be shared with an arbitrary external party, may also not be entered into a generative AI service that has not been approved by the LUMC for that purpose.

The current practical implementation, including examples and a decision route, is included in Appendix A – Practical Guide for the Use of Generative AI.

6. Responsible use of generative AI

When generative AI may be used in accordance with this policy, careful use remains necessary. Generative AI is a powerful tool, but the generated output is not inherently correct, complete, or suitable for the purpose for which it is used. The user therefore remains responsible for the manner in which generative AI is used and for the ultimate use of the result.

Responsible use does not mean that every AI output must be extensively checked or that higher requirements are imposed on generative AI than on other tools. The required level of care must be proportionate to the purpose and the possible consequences of its use. For example, a proposed meeting agenda requires a different degree of review than a text that is used in an administrative decision or communication with a patient.

This chapter describes the main points of attention for the responsible use of generative AI.

6.1 Reliability

Generative AI can produce convincingly formulated information that is incorrect, incomplete, or outdated. The accuracy of generated information is therefore not guaranteed. Users should not simply accept generated

information as fact when its accuracy is relevant to its intended use. The required verification is risk-based. The greater the consequences of an error, the more certainty the user must obtain regarding the correctness of the output.

6.2 Sources

A generative AI service is not automatically a reliable source. Generated references to scientific publications, legislation, case law, or other sources may be incorrect or non-existent. When source references are relevant, the user consults the original source.

6.3 Intellectual property and copyright

Existing rules regarding intellectual property, copyright, and licences continue to apply when using generative AI. The user should take into account any possible rights of third parties relating to information provided to an AI service and to generated content that is reused. Generative AI may not be used to circumvent existing restrictions on copying, sharing, or reusing information.

6.4 Professional responsibility

Generative AI may support work activities, but the user remains responsible for his or her own professional conduct. Users are not expected to reproduce every generated text entirely from scratch or to prove every suggestion individually. However, they are expected to apply a level of review that is reasonable in light of the intended use and the possible consequences.

6.5 Data minimisation

Even when a generative AI service has been approved for processing personal data or patient data, no more data should be entered than is

reasonably necessary for the intended purpose. The user therefore limits the information contained in a prompt, document, or other input to the data that is relevant for the requested assistance. Where a portion of a document or file is sufficient, the entire document or file should not be entered without necessity. This principle also applies to LUMC Copilot.

The fact that an AI service has been approved for processing certain data means that those data may be processed within that service, but it does not mean that it is necessary or desirable to process all available data for every use.

6.6 Transparency

The use of generative AI may form part of the way in which the LUMC processes personal data and patient data. Where the use of generative AI is relevant to the information that must be provided to data subjects under the GDPR or other applicable regulations, appropriate transparency shall be provided. For this purpose, the LUMC aligns as much as possible with existing information channels, such as the privacy statement and patient information materials.

The use of generative AI as a supporting tool does not automatically create an obligation to state, for every individual application or every generated document, that generative AI has been used. For example, a physician who uses an AI service approved for this purpose to make a patient letter easier to understand, and who subsequently reviews and authorises the final letter, does not need to inform the patient of this.

When the nature or impact of the use of generative AI is such that separate transparency towards the data subject is necessary, this information shall be provided. An example would be the use of AI chatbots to communicate with patients. Such use must be made known to the persons concerned.

7 Responsibilities and Support

7.1 User

The user is responsible for the careful use of generative AI within his or her activities. This means, among other things, that the user:

- determines whether the intended use falls within the scope of this policy;
- when using AI services other than those assessed by the LUMC for that purpose, determines whether the information used may be shared with that service;
- reviews the output to a degree appropriate to the intended use;
- continues to follow existing professional and organisational rules.

Users are not expected to possess specialist knowledge of AI, privacy, or information security. The policy and supporting information should enable an employee to independently answer most day-to-day usage questions.

If there is relevant doubt regarding the permissibility of the intended use, the sharing of information, or the reliability of the output, the user shall not act on the basis of the AI output and shall not share information with the AI service until the doubt has been resolved. Where necessary, advice shall be sought through the appropriate LUMC channels.

7.2 Manager and Process Owner

Managers and process owners facilitate the responsible use of generative AI within their work processes. They provide employees with the opportunity to make responsible use of generative AI and at the same time ensure that specific risks associated with a particular process or application are identified in a timely manner.

Responsibility for the work process remains with the line organisation.

7.3 AI expertise, privacy, information security and ethics

The relevant areas of expertise within the LUMC support the organisation in the responsible deployment of generative AI.

The AI Team provides support with questions regarding the possibilities and application of generative AI. Privacy advises on data protection. The CISO and ISOs advise on information security risks. The Department of Ethics and Law in Healthcare may be involved where the use of generative AI raises relevant ethical or societal issues. These functions provide support and advice, but they do not assume responsibility for the use of generative AI from the line organisation, process owner, or user.

8 Current information and maintenance

Generative AI is developing rapidly. Functionalities, suppliers, contractual conditions, and technical capabilities change more quickly than a formal policy document can responsibly be updated. The formal policy therefore contains, as much as possible, stable guiding principles. Product-specific and version-specific information is, where possible, included in the practical user guide and other current supporting information.

Changes to the practical user guide that relate solely to available or approved AI services, examples, or practical explanations, and that do not constitute a change to the policy principles, do not require the entire policy to be formally reapproved.

The LUMC maintains separate up-to-date practical information in which employees can see:

- which generative AI services have been assessed by the LUMC;
- for which data categories these services are suitable;
- which specific conditions apply;
- practical examples of permitted and non-permitted use;

- where employees can go with questions.

The Practical User Guide in Appendix A forms the operational translation of this policy and may be updated when new AI services become available or when existing services are assessed differently.

9 Compliance and Evaluation

Use of generative AI that is contrary to this policy shall be handled in accordance with the existing LUMC frameworks relating, among other things, to information security, privacy, professional conduct, and integrity.

When the use of generative AI may involve a breach of the protection of personal data or another privacy incident, this shall be reported and handled in accordance with the GDPR reporting procedure applicable within the LUMC. This applies, for example, when personal data or patient data have unintentionally been entered into an AI service that is not suitable for that purpose, or have otherwise been unlawfully processed or shared. Such situations, or suspicions thereof, must be reported to the Privacy department, as a personal data breach may have occurred.

No separate sanctions regime will be introduced for generative AI. This policy shall be evaluated periodically and, where necessary, adapted to technological developments, experiences within the LUMC, and changes in legislation and regulations. During this evaluation, consideration will be given both to whether the policy provides sufficient safeguards for the responsible use of generative AI and to whether the rules prove to be unnecessarily restrictive in practice for applications that can responsibly be permitted.

Appendix A – Practical Guide for Generative AI

This appendix helps you quickly determine whether and how you can use generative AI within your work activities.

In this appendix we mean by:

LUMC Copilot

By LUMC Copilot we mean the Microsoft 365 Copilot environment made available by LUMC. Employees can use this officially approved Microsoft 365 Copilot environment by logging in with their LUMC account on their LUMC work laptop. LUMC Copilot is then available through the web version in Microsoft Edge, via the Copilot icon in the top right corner of the browser under the option “Chat”.

Other Copilot environments accessed through the internet (for example via a search engine) or downloaded separately through the Microsoft Store do not fall under the Microsoft 365 Copilot environment offered by LUMC.

The LUMC Copilot environment may be used for all LUMC data categories, including confidential information, personal data and patient data, provided that you yourself are authorized to use that information. LUMC has assessed this environment and determined it to be suitable for processing these data.

Other AI

“Other AI” refers to generative AI services that have not been approved by LUMC for processing protected LUMC information, such as personal or independently used versions of ChatGPT, Claude, Gemini, DeepSeek and Perplexity. LUMC may approve other AI services in the future. If this happens, this appendix will be updated.

The principle is simple: Generative AI as a tool is permitted. LUMC Copilot may be used for all types of LUMC information. Other AI services may also

be used, provided that the information you enter can responsibly be shared with that external service.

1. The Quick Decision Route

Use this route before deploying generative AI.

Do you use LUMC Copilot?

Yes:

You may process all types of LUMC information in it, provided that you are authorized to use that information yourself.

Do not enter more personal data or patient data than necessary for the purpose. Then assess whether what you want to do with AI falls within this policy.

No:

You are using another AI service. Then ask yourself:

Can I responsibly share the information I want to enter with the provider of this AI service?

For public and non-sensitive information, this is in principle possible.

Do not use other AI for:

- patient data;
- personal data;
- confidential or highly confidential LUMC information;
- or other information that cannot responsibly be shared with the provider.

If in doubt? Use LUMC Copilot.

A-1 Meetings, Collaboration and Administrative Activities

I want to...	Is this allowed?	Which AI may I use?	Note
Have an agenda for a team meeting prepared without sensitive information	Yes	LUMC Copilot or other AI	—
Make a text clearer or more concise	Yes	LUMC Copilot or other AI	Other AI only if the text does not contain information that you may not share externally
Summarize an internal, non-sensitive work instruction	Yes	LUMC Copilot or other AI	The fact that something is “internal” does not automatically mean that other AI may not be used
Summarize a confidential	Yes	LUMC Copilot	

I want to...	Is this allowed?	Which AI may I use?	Note
Executive Board memorandum			
Create a presentation based on confidential internal documents	Yes	LUMC Copilot	Check facts and conclusions
Summarize minutes of a regular meeting	Yes	LUMC Copilot if the minutes contain personal data or sensitive information; otherwise other AI is also permitted	Look at the contents of the minutes
Record, transcribe and summarize a meeting	Yes, but conditionally	LUMC Copilot if personal data or sensitive information are discussed during the meeting; otherwise other AI is also permitted	Also follow LUMC agreements for recording and transcription, such as deleting transcripts after processing
Extract action points from a non-sensitive meeting report	Yes	LUMC Copilot or other AI	Check action owner and deadline
Extract action points from a meeting	Yes	LUMC Copilot	Check the output

I want to...	Is this allowed?	Which AI may I use?	Note
containing patient, HR or other sensitive information			

A-2 Patient Care – Administrative and Textual Support

For patient data, the practical rule is simple:

Does your prompt or material contain patient data?

Use only LUMC Copilot.

Within this policy, generative AI may display, organize, summarize, translate and rephrase existing patient information. AI may not independently determine what that information medically means for the patient. In short: AI may help present what we already know; it may not independently determine what this medically means for the patient.

I want to...	Is this allowed?	Which AI may I use?	Note
Present a patient record more concisely and clearly	Yes, conditionally	LUMC Copilot	Let AI present and structure existing information; do not let AI add new medical

I want to...	Is this allowed?	Which AI may I use?	Note
			conclusions; check that no essential information needed for good care is missing
Create a chronological overview of information from a patient file	Yes, conditionally	LUMC Copilot	Check completeness
Summarize a consultation report	Yes, conditionally	LUMC Copilot	AI presents the recorded information; check that no essential information needed for good care is missing
Use an ambient AI scribe to record and automatically document a patient consultation	Yes, conditionally	LUMC Copilot	Follow the conditions applicable to this use case regarding recording, patient information, data processing and review of documentation. The AI scribe may not propose diagnoses or otherwise generate medical interpretations
Extract previously recorded agreements or administrative action points from a	Yes, conditionally	LUMC Copilot	Review before actions are carried out

I want to...	Is this allowed?	Which AI may I use?	Note
consultation report			
Draft a patient letter based on information already established	Yes, conditionally	LUMC Copilot	The healthcare professional determines the medical content and reviews the final letter
Rewrite an existing patient letter in more understandable language	Yes, conditionally	LUMC Copilot	Check that the medical meaning does not change
Translate a patient letter	Yes, conditionally	LUMC Copilot	Check important medical wording
Summarize an MDT report	Yes, conditionally	LUMC Copilot	Only present what was discussed/established; check that no essential information needed for good care is missing
Extract which medication is recorded in a file	Yes, conditionally	LUMC Copilot	Retrieval is permitted; medical assessment of the medication falls outside this policy
Have AI determine which information from a file is clinically relevant	Outside this policy	—	AI would then be making a medical assessment itself

I want to...	Is this allowed?	Which AI may I use?	Note
Ask AI which diagnosis is most likely	Outside this policy	—	Medical assessment
Ask AI whether symptoms fit a particular diagnosis	Outside this policy	—	Patient-specific medical assessment
Ask AI whether medication is appropriate	Outside this policy	—	Assessment of treatment
Have AI make a treatment proposal	Outside this policy	—	Medical recommendation
Have AI estimate the risk of a complication	Outside this policy	—	Patient-specific medical risk assessment
Have AI prioritize patients based on medical urgency	Outside this policy	—	Triage

A-3 Research and Academic Activities

A researcher may simply use generative AI as an everyday tool. Only when AI becomes part of the scientific research itself does the use fall outside this policy.

I want to...	Is this allowed?	Which AI may I use?	Note
Summarize a public scientific article	Yes	LUMC Copilot or other AI	Take copyright/licensing conditions into account
Use AI as a general sparring partner while exploring a scientific topic, without processing research data or protected research information	Yes	LUMC Copilot or other AI	AI output is not a scientific source
Improve my own text linguistically	Yes	LUMC Copilot or other AI	Other AI may be used for public information and for information where external access does not pose a

I want to...	Is this allowed?	Which AI may I use?	Note
			relevant risk and to which no legal, contractual or other restrictions apply
Linguistically improve a draft scientific article	Yes, conditionally	LUMC Copilot or other AI, depending on the content	Before using other AI, check whether the draft contains unpublished research results, personal data, confidential information, intellectual property, or information under embargo or confidentiality agreements. If so, use only an AI service approved by LUMC for that information
Improve a confidential grant application	Yes	LUMC Copilot or other AI, depending on the content	
Make an abstract shorter or clearer	Yes	LUMC Copilot or other AI, depending on the content	The researcher remains responsible for the content

I want to...	Is this allowed?	Which AI may I use?	Note
Ask AI for generic programming code or a statistical formula	Yes	LUMC Copilot or other AI	Check the generated code/formula
Have AI analyze research data as part of a research project	Outside this policy	—	A separate research framework applies
Develop, train or validate an AI model as a research activity	Outside this policy	—	A separate research framework applies

A-4 Education and Training

I want to...	Is this allowed?	Which AI may I use?	Note
Help structure teaching material	Yes	LUMC Copilot or other AI	Other AI only if the information used may be shared externally
Create a fictional practice case	Yes	LUMC Copilot or other AI	Do not use real patient data in other AI
Generate practice questions	Yes	LUMC Copilot or other AI	Review questions and answers
Create a presentation or initial lesson outline	Yes	LUMC Copilot or other AI	Review the content
Process data of individual students	Yes, conditionally	LUMC Copilot	Existing privacy rules remain applicable

I want to...	Is this allowed?	Which AI may I use?	Note
Use AI for assessment or examination of individual students	Outside this policy	—	Separate educational and examination rules apply

A-5 Operations, HR, IT and Policy

I want to...	Is this allowed?	Which AI may I use?	Note
Write a vacancy text	Yes	LUMC Copilot or other AI	—
Rewrite a generic job profile	Yes	LUMC Copilot or other AI	Do not enter personal data into other AI
Improve an internal, non-sensitive work process	Yes	LUMC Copilot or other AI	“Internal” does not automatically mean confidential
Structure a confidential proposal	Yes	LUMC Copilot	
Summarize a personnel file	Yes, conditionally	LUMC Copilot	Existing HR and privacy rules remain applicable

I want to...	Is this allowed?	Which AI may I use?	Note
Summarize a CV or application letter	Yes, conditionally	LUMC Copilot	Do not allow AI to independently assess or select candidates
Summarize a confidential contract	Yes	LUMC Copilot	Take contractual agreements and third-party rights into account
Have an Excel formula written without sharing LUMC data	Yes	LUMC Copilot or other AI	—
Have generic SQL or programming code generated	Yes	LUMC Copilot or other AI	Review the code
Have LUMC code or configuration containing sensitive information assessed	Yes	LUMC Copilot	Do not enter sensitive technical information into other AI
Summarize an internal security report	Yes	LUMC Copilot	
Have AI independently perform changes in systems	Outside this policy	—	This concerns autonomous/agent AI
